March 7, 1996

To Metalon Products:

Shaughnessy Golf Course started to use the Metalon line of lubricants in 1988. Since that year, the bearing failure has been reduced by 95%.

We purchased two Toro 223 D's in 1990. I am proud to state that up to this year (1996) we are still running with the factory installed bearings and seals in all cutting units and rollers. These units have more than 3000 Hrs each. Since the dealership was always informed of the findings that we found with Metalon grease, oil and diesel additive we have received greater trade in value for our units.

Any Motors that we have done any repairs to had between 2500 and 3500 hours on them. When rebuilding these units we've noticed minimum wear on cylinder walls and crank pins. So repairs here keep to a minimum. These units are still being used today.

We've used the Metalon fuel conditioners in all units and I have yet to rebuild an injector or pump in any diesel powered units.

We are very pleased with the results of using Metalon and would recommend Metalon to anyone who is interested in preventative maintenance.
